

Implementation Plan

Scalable on-prem Keycloak platform — Active Directory, MFA, and application SSO — aligned to the approved customer scope. Designed to grow beyond the initial deployment footprint.

June 2026

1. Purpose of this document

This document describes **how I will implement** the on-prem Keycloak IAM scope — platform deployment, Active Directory integration, MFA, and application SSO — and the **total budget** for my technical delivery.

The platform is architected for **organizational scale**, not only the first customer rollout. The current project may start with a defined user base; the same design supports additional users and applications as you grow.

Scope covered by this plan

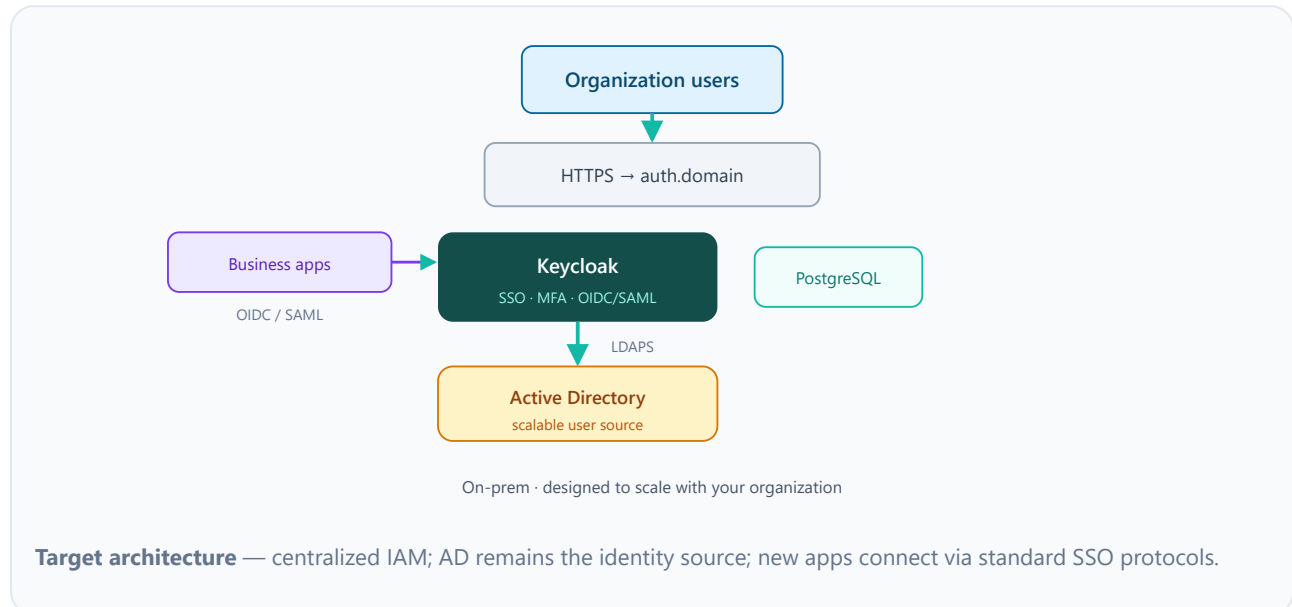

Requirement	Delivery
On-prem Keycloak + PostgreSQL	Deployed, hardened, documented platform
Active Directory / LDAPS	Federation, sync, group mapping, tested auth
MFA (authenticator OTP)	Policy, enrollment flow, admin procedures
SSO for up to 8 applications	OIDC and SAML client configuration per app
Handover & documentation	Admin guide, backup/restore, knowledge transfer

Delivery model

- **SecureLink** — customer coordination, access, UAT scheduling with app owners
- **Talha Bilal** — Keycloak engineering, AD federation, MFA, app SSO, technical documentation
- **Customer IT** — infrastructure, AD service account, DNS/TLS, firewall

2. Technical approach

I operate on-prem Keycloak in production today: AD/LDAP federation, OIDC application SSO, and realm lifecycle at scale. This engagement uses the same architecture pattern — built to add users and applications without redesign.

3. Phase-by-phase delivery plan

Six phases aligned to the approved customer scope. Remote delivery over a **4–6 week** window.

1

Discovery & design

- Kickoff with IT and application owners
- Validate AD topology, LDAPS, and SSO protocol per app (OIDC / SAML)
- Technical design: realm, federation, firewall matrix, cutover plan

2

Platform deployment

- Keycloak + PostgreSQL on customer infrastructure
- TLS, admin RBAC, brute-force protection, session policies, logging
- Backup baseline and health validation

3

Active Directory / LDAPS

- LDAP user federation (bind account, search bases, username attribute)
- Group-to-role mapping; directory sync
- Validate login, disabled accounts, and group changes

4

MFA configuration

- TOTP authenticator policy per agreed scope
- Pilot enrollment with IT team; admin reset procedure documented

5

Application SSO (up to 8 apps)

- Per app: client setup, metadata / redirect URIs, claims, logout
- Support application owner UAT through sign-off
- Includes agreed applications from customer scope (e.g. Dynamics, ServiceDesk Plus, Endpoint Central, portal, Temenos, and others as confirmed)

6

Testing & handover

- Regression: AD, MFA, and SSO flows
- Administrator guide, backup/restore procedure, knowledge transfer session
- Implementation close-out documentation

4. Budget

Fixed **USD 2,500** for complete remote technical delivery of Phases 1–6 described above.

Phase	Work	USD
1	Discovery & technical design	400
2	Keycloak + PostgreSQL deployment & hardening	600
3	Active Directory / LDAPS federation	400
4	MFA (TOTP) configuration	200
5	Application SSO — up to 8 applications	700
6	Testing, documentation & handover	200
Total		2,500

Total implementation budget

USD 2,500

Fixed price · Remote delivery · Phases 1–6
